

Gro-Maxx, BIO-EIF™

Biological Enhanced in Furrow

Gro-Maxx EIF™ is a special Biological high energy formulation to improve early seedling vigor, help minimize early seedling stress and improve early root health and development

Gro-Maxx BIO-EIF™ contains a special formulation of nitrogen, phosphate, potash and sulfur. Added are chelated zinc, manganese, and magnesium nutrients. A product is added to minimize early ethylene buildup from weather stress conditions. Fulvic acid is also added to improve nutrient availability and plant health.

In addition to the above, at the time of product delivery or when picked up for planting, a special blended formulation of bacterias, fungi, algae, enzymes and minerals are added to the mix to help support the growth of microbial life around the plants root system.

This BIO-EIF formulation is designed to be applied in the seedling trench with the corn seed at a minimum of 5.0 gal /ac. for 30" row planting. If row 2X2 application is made with planter, and/or early nitrogen is applied with herbicides, no addition nitrogen should be added to this in-furrow mix. If no 2X2 or other early nitrogen is being used, an additional 1.0 gal /ac of 28% N can be added to the mixture. No other fertilizers should be used with this formulation.

LUCKEY FARMERS, INC.

Luckey Farmers, Inc. is dedicated to providing the highest quality farm products and services for the success of our members, employees, and community
